One of the larger challenges in mobile enterprise computing has always been giving road-warriors access to their in-house environment when away from their desks. RingCube has introduced a system to provide [secure access](#) from essentially any connection on the Internet. The foundation of the system is a USB key that holds complete environment information for the user's [laptop computer](#). The system, called MojoDrive, provides a complete image of the user's environment wherever they go. MojoDrive will even work to give the user their familiar environment on a stranger's computer--and it erases all traces of the environment from the host computer when it's unplugged.
